No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

                     The present invention relates to a method for treating or preventing allergic rhinitis. The method involves employing a blood-feeding ectoparasite-derived (e.g. tick-derived) histacalin protein. The presequence is one such histacalin protein. The histacalin protein, is useful for treating or preventing allergic rhinitis, both seasonal apperennial allergic conjunctivitis.
                                                                                                                                                                                                                            Use of histacalin proteins for treating or preventing allergic rhinitis, or for manufacturing a medicament for treating or preventing allergic rhinitis, e.g. seasonal or perennial allergic rhinitis
                                                                                                                                                                                        Disclosure;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC HSP2 (see AAW37446-47) and a related protein, D.RET6 (see AAW37449)
CC from Dermacenter reticularis, were also identified. These novel
CC vasoactive amine binding proteins (VABPs) can be expressed in
CC bost cells using e.g. a baculovirus expression system. They can
CC be used: (i) to assay histamine (or other VA such as serotonin) in
CC body fluids or cell culture supernatants, e.g. to monitor the
CC effect of allergens; (ii) for binding VA, e.g. to remove histamine or
CC from blood, food, cell cultures etc.; (iii) as an antihistamine or
CC anti-inflammatory agents, e.g. for treating insect, snake or
CC corpion bites or dermatitis, or as a carrier for slow release of
CC statamine-related compounds; (iv) in vaccines to protect against
CC metazoan parasites, especially in animals; (v) as reagents for
CC studying inflammation, involvement of VA in ulcer formation or the
CC immune response etc. VABPs provide a more sensitive assay for
CC histamine than low-affinity antibodies currently used. They may
CC also be more effective and safer than conventional antihistamines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The compounds are useful for regulating the action of histamine and serotonin (in e.g. inflammation and gastric acid secretion), the detection, quantification and removal of histamine or serotonin (in animals, plants, cell cultures, food materials, or humans) and in the treatment of various diseases and allergies (e.g. type I hypersensitivity reactions, urticaria, asthma, allergic rhinitis (hay fever), atopic dermatitis, insect bites and food and drug allergies, abnormal blood pressure, migraine, psychological disorders, respiratory disease, and coronary heart disease). Histamine may also be used as components of vaccines directed against blood-sucking also be used as components of vaccines directed against blood-sucking

                                   The present invention relates to a method for treating or preventing allergic rhinitis. The method involves employing a blood-feeding ectoparasite-derived (e.g. tick-derived) histocalin protein. The presequence is one such histocalin protein. The histocalin protein, is useful for treating or preventing allergic rhinitis, both seasonal are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               e present invention relates to the use of a histacalin protein r treating or preventing conjunctivitis. The present sequence the histacalin protein FS-HBP1. The invention is particularly the treatment of allergic or seasonal conjunctivitis.
                                                                                                                              of histacalin proteins for treating or preventing allergic nitis, or for manufacturing a medicament for treating or preventing ergic rhinitis, e.g. seasonal or perennial allergic rhinitis

This protein comprises tick Rhipicephalus appendiculatus (Ra) novel female-specific histamine binding protein 2 (FS-HBP2). Its amino acid sequence was deduced from a cDNA clone (see AAV0022B) obtained from a salivary gland cDNA library. FS-HSP1 (see AAW37446) and male-specific HSP1 (see AAW37448) and a related protein, D.RET6 (see AAW37449) from Dermacenter reticularis, were also identified. These novel vasoactive amine binding proteins (VABPs) can be expressed in host cells using e.g. a baculovirus expression system. They can be used: (i) to assay histamine (or other VA such as serotonin) in body fluids or cell culture supernatants, e.g. to monitor the effect of allergens; (ii) for binding VA, e.g. to remove histamine
                                                                                                                                                                                           New vasoactive amine binding proteins and related nucleic acid, vectors - transformed cells and transgenic animals, used for assaying or removing histamine and as antihistamine or anti-inflammatory agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          histamine; serotonin; assay; insect bite; snake bite; scor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         anti-inflammatory agents, e.g. for treating insect, snake or scorpion bites or dermatitis, or as a carrier for slow release of histamine-related compounds; (iv) in vaccines to protect against metazoan parasites, especially in animals; (v) as reagents for studying inflammation, involvement of VA in ulcer formation or the immune response etc. VABPs provide a more sensitive assay for histamine than low-affinity antibodies currently used. They may also be more effective and safer than conventional antihistamines
This sequence is an example of a histamine or serotonin binding compound (A), of the invention. The compounds are useful for regulating the action of histamine and serotonin (in e.g. inflammation and gastric acid secretion), the detection, quantification and removal of histamine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                         allergic rhinitis. The method involves employing a blood-feeding ectoparasite-derived (e.g. tick-derived) histacalin protein. The sequence is one such histacalin protein. The histacalin protein, useful for treating or preventing allergic rhinitis, both season perennial allergic conjunctivitis.
                                                                                                                                                                                                                                                                                                                                        Use of histacalin proteins for treating or preventing allergic rhinitis, or for manufacturing a medicament for treating or preventing rhinitis, e.g. seasonal or perennial allergic rhinitis
                                                                                                                                                                                                   Sequence

RESULT 11
AAW37446
                                from a salivary gland cDNA library. FS-HSP2 and male-specific
HSP1 (see AAW37447-48) and a related protein, D.RET6 (see AAW37449)
Cfrom Dermacenter reticularis, were also identified. These novel
crown because the binding proteins (VABPs) can be expressed in
thost cells using e.g. a baculovirus expression system. They can
be used: (1) to assay histamine (or other VA such as serotonin) in
the body fluids or cell culture supernatants, e.g. to monitor the
ceffect of allergens; (ii) for binding VA, e.g. to remove histamine
ceffect of allergens; (ii) for binding VA, e.g. to remove histamine
ceffect of allergens; (ii) for binding VA, e.g. to remove histamine
ceffect of allergens; (ii) for binding VA, e.g. to remove histamine
ceffect of allergens; (ii) for treating insect, snake or
anti-inflammatory agents, e.g. for treating insect, snake or
scorpion bites or dermatitis, or as a carrier for slow release of
histamine-related compounds; (iv) in vaccines to protect against
metazoan parasites, especially in animals; (v) as reagents for
studying inflammation, involvement of VA in ulcer formation or the
immune response etc. VABPs provide a more sensitive assay for
histamine than low-affinity antibodies currently used. They may
also be more effective and safer than conventional antihistamines.
                                                                                                                                                                                                                                                                                                                                                                     This protein comprises tick Rhipicephalus appendiculatus (Ra) novel female-specific histamine binding protein 1 (FS-HBP1). Its amino acid sequence was deduced from a cDNA clone (see AAV00227) obtained
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New vasoactive amine binding proteins and related nucleic vectors - transformed cells and transgenic animals, used fassaying or removing histamine and as antihistamine or

                                                                                               This sequence is an example of a histamine or serotonin binding compound (A), of the invention. The compounds are useful for regulating the action of histamine and serotonin (in e.g. inflammation and gastric acid secretion), the detection, quantification and removal of histamine or serotonin (in animals, plants, cell cultures, food materials, or humans) and in the treatment of various diseases and allergies (e.g. type I hypersensitivity reactions, urticaria, asthma, allergic rhinitis (hay fever), atopic dermatitis, insect bites and food and drug allergies, abnormal blood pressure, migraine, psychological disorders, respiratory disease, and coronary heart disease). Histamine may also be used to regulate cellular growth and tissue repair. The molecules may also be used as components of vaccines directed against blood-sucking
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          gastric acid secretion; allergy; type I hypersensitivity reaction; asthma; urticaria; allergic rhinitis; atopic dermatitis; food allergy; drug allergy; abnormal blood pressure; psychological disorder; vaccine; respiratory disease; coronary heart disease; cellular growth regulator; tissue repair; blood-sucking ectoparasite; therapy.

                                          library. The compounds are useful for regulating the action of histamine and serotonin (in e.g. inflammation and gastric acid secretion), the detection, quantification and removal of histamine or serotonin (in animals, plants, cell cultures, food materials, or humans) and in the treatment of various diseases and allergies (e.g. type I hypersensitivity reactions, urticaria, asthma, allergie rhinitis (hay fever), atopic dermatitis, insect bites and food and drug allergies, abnormal blood pressure, migraine, psychological disorders, respiratory disease, and coronary heart disease). Histamine may also be used to regulate cellular growth and tissue repair. The molecules may also be used as components of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          gastric acid secretion; allergy; type I hypersensitivity reaction; asthma; urticaria; allergic rhinitis; atopic dermatitis; food allergy; drug allergy; abnormal blood pressure; psychological disorder; vaccine; respiratory disease; coronary heart disease; cellular growth regulator; tissue repair; blood-sucking ectoparasite; therapy.

           This sequence is an example of a histamine or serotonin binding compound (A), of the invention. cDNA encoding this sequence was isolated from a mixed Boophilus microplus/Ixodes hexagonus cDNA expression library. The compounds are useful for regulating the action of histamine and serotonin (in e.g. inflammation and gastric acid secretion), the detection, quantification and removal of histamine or serotonin (in animals, plants, cell cultures, food materials, or humans) and in the treatment of various diseases and allergies (e.g. type I hypersensitivity reactions, urticaria, asthma, allergic rhinitis (hay fever), atopic dermatitis, insect bites and food and drug allergies, abnormal blood pressure, migraine, psychological disorders, respiratory disease, and coronary heart disease). Histamine may also be used to regulate cellular growth and tissue repair. The molecules may also be used as components of

This protein comprises tick Dermacenter reticularis (Dr) novel vasoactive amine binding protein (VABP) D.RET6. Its amino acid sequence was deduced from a CDNA Clone (see AAV00230) obtained from a Dr salivary gland cDNA library. 3 Novel VASPs, designate of the control of the c

sequence was deduced and cDNA library. 3 Nover from a Dr salivary gland cDNA library. 3 Nover FS-HBP1, FS-HBP2 and MS-HBP1 (see AAW37446-48),

of the tich

designated

                                                                                                                                                                                                                                                                                                                               õ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 VABPs can be expressed in host cells using e.g. a baculovirus cexpression system. They can be used: (i) to assay histamine (or other VA such as serotonin) in body fluids or cell culture supernatants, e.g. to monitor the effect of allergens; (ii) for binding VA, e.g. to remove histamine from blood, food, cell cultures etc.; (iii) as an antihistamine or anti-inflammatory agents, e.g. for treating insect, snake or scorpion bites or dermatitis, or as a carrier for slow release of histamine-related compounds; (iv) in vaccines to protect against metazoan parasites, especially in animals; (v) as reagents for studying inflammation, involvement of VA in ulcer formation or the immune response etc. VABPs provide a more sensitive assay for histamine than low-affinity antibodies currently used. They may also be more effective and safer than conventional antihistamines.
                                                                                                                                                                                                                                                                                                                                                                                   Query Match 25.4%; Score 251.5; DB 19; Length 209; Best Local Similarity 35.3%; Pred. No. 18 the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
